 cfjedimaster updates

28472ce on May 27 10 commits

examples	updates	2 months ago
.gitignore	updates	5 months ago
links.html	why didnt i add this before	10 months ago
preso.pdf	updates	2 months ago
preso.pptx	updates	2 months ago
readme.md	updates	2 months ago

readme.md

This repository contains my slide deck (in both PPT and PDF, but I may not always keep the PDF up to date) and demos for my Vue.js presentation.

Note - the CodePen demos may be found here: <http://bit.ly/rayvuedemos>

Change Log:

5/26/2020: Updates for pre 3.0 era, changed ajax-search to open brewery db (but kept ajax-search-2 as is). ToDo, fix master-detail issue w/ Star Wars API.

About

For my general, one hour intro to the awesomeness that is Vue.

javascript vuejs

About

WHY VUE?

Let's back up...

WHY VUE?

SIMPLE

NO BUILD PROCESS

SCALABLE

QUICK VUE FACTS

Created by Evan You (@youyuxi)

Released in February of 2014

Currently is version 2.6.11

Main site: vuejs.org

GitHub: <https://github.com/vuejs>

BRACE YOURSELF

VUE3 IS COMING

VUE 3.0

When?

- Really soon now! (RC)

What?

- More later!

Where?

- <https://github.com/vuejs/vue-next>

WHAT DOES VUE DO?

Two-way binding between your DOM and JavaScript

Template Language (aka Declarative Rendering)

And I know I said this - but it does more. A lot more.

INSTALLATION

npm install

cli install

Download from site

Copy and paste a script tag FTW!!!!1!

<SCRIPT> STYLE

```
<script src="https://unpkg.com/vue"></script>
```

WRITE SOME CODE!

Identify where you're going to render stuff

Setup some data

Render that data

Add events (ie on this do that) and other fancy stuff

Willy Nilly DOM Manipulation

`$('#somediv').html('woot');`

`$('#someotherdiv').val(2);`

`$('#yetanotherdiv').html('This is awesome');`

Defining Vue's Place...

EXAMPLES

<http://bit.ly/rayvuedemos>

```
<!-- header stuff -->  
<div id="app">  
</div>  
<!-- footer stuff -->
```

```
var app = new Vue({  
  el: '#app',  
  data: {  
    name: "Ray",  
    age: 44  
  }  
});
```

SOME CODE...

```
<!-- header stuff -->
<div id="app">
My name is {{name}} and
I'm {{age}} years old.
</div>
<!-- footer stuff -->
```

```
var app = new Vue({
  el: '#app',
  data: {
    name: "Ray",
    age: 44
  }
});
```

SOME MORE CODE...

```
<div id="app">
  My name is {{name}}.
  <span v-if="age > 40">
    I remember floppies.
  </span>
</div>
```

```
<div id="app">
  My name is {{name}}.
  <span v-if="age > 40">
    I remember floppies.
  </span><span v-else>
    What's a floppy?
  </span>
</div>
```

TEMPLATE DIRECTIVES - CONDITIONALS

```
<div id="app">
  My name is {{name}}. Here
  are things I like:
  <ul>
    <li v-for="thing in things">
      {{thing}}
    </li>
  </ul>
</div>
```

```
var app = new Vue({
  el: '#app',
  data: {
    name: "Ray",
    things: [
      "cats",
      "star wars",
      "beer"
    ]
  }
});
```

TEMPLATE DIRECTIVES - LOOPS

WORKING WITH FORM FIELDS

v-model links to data field

Works in all kinds of form fields

<https://www.raymondcamden.com/2020/01/27/vue-and-form-fields>

```
<div id="app">
  <input type="text" id="name" v-model="name"><br/>
  My name is {{name}}.
</div>
```

```
var app = new Vue({
  el: '#app',
  data: {
    count: 0
  },
  methods: {
    doIt: function() {
      this.count++;
    }
  }
})
```

EVENTS

v-on:click="something"

Defined in methods block of Vue instance

Easy to do modifiers (v-on:submit.prevent)

@click="something"

```
<div id="app">
  <button v-on:click="doIt">Do It</button><br/>
  You did it {{count}} times.
</div>
```

ATTRIBUTE BINDING

`v-bind:attribute="value"`

`:attribute="value"`

`v-bind:style="{bgcolor:curColor, font-style:textStyle}"`

`v-bind:class="{highlighted:isActive, color:appStatus}"`

```
<div id="app">
  
</div>
```

COMPUTED PROPERTIES

Virtual properties

Property X is based on real data A and B

Defined in the `computed` part of the Vue instance

```
<div id="app">
  <h2>Male Cats</h2>
  <ul>
    <li v-for="cat in cats"
        v-if="cat.gender === 'Male'">{{cat.name}}</li>
  </ul>

  <h2>Female Cats</h2>
  <ul>
    <li v-for="cat in cats"
        v-if="cat.gender === 'Female'">{{cat.name}}</li>
  </ul>
</div>
```

```
var app = new Vue({
  el: '#app',
  data: {
    cats: [
      { "name": "Alred", "gender": "Male" },
      { "name": "Barry", "gender": "Male" },
      { "name": "China", "gender": "Female" },
      { "name": "Dolores", "gender": "Female" },
      { "name": "Enya", "gender": "Female" },
      { "name": "Franke", "gender": "Male" },
      { "name": "Georgia", "gender": "Female" }
    ]
  }
})
```

EXAMPLE (BEFORE)

```
<div id="app">
  <h2>Male Cats</h2>
  <ul>
    <li v-for="cat in maleCats">{{cat.name}}</li>
  </ul>

  <h2>Female Cats</h2>
  <ul>
    <li v-for="cat in femaleCats">{{cat.name}}</li>
  </ul>
</div>
```

```
var app = new Vue({
  el: '#app',
  data: {
    cats: [
      { "name": "Alred", "gender": "Male" },
      { "name": "Barry", "gender": "Male" },
      { "name": "China", "gender": "Female" },
      { "name": "Dolores", "gender": "Female" },
      { "name": "Enya", "gender": "Female" },
      { "name": "Franke", "gender": "Male" },
      { "name": "Georgia", "gender": "Female" }
    ]
  },
  computed: {
    maleCats: function() {
      return this.cats.filter(c => c.gender === 'Male' );
    },
    femaleCats: function() {
      return this.cats.filter(c => c.gender === 'Female' );
    }
  }
})
```

EXAMPLE (AFTER)

VUE LIFECYCLE EVENTS

Events that occur while a Vue instance is doing stuff

beforeCreate, created, beforeMount, mounted, beforeUpdate, updated, activated, deactivated, beforeDestroy, destroyed, errorCaptured

<https://vuejs.org/v2/api/#Options-Lifecycle-Hooks>

EXAMPLE

```
var app = new Vue({
  el: '#app',
  data: {
    films: []
  },
  created: function() {
    fetch('https://swapi.co/api/films/')
      .then(res => res.json())
      .then(res => {
        this.films = res.results;
      })
  }
})
```

```
<div id="app">
  <ul>
    <li v-for="film in films">
      {{film.title}}
    </li>
  </ul>
</div>
```

QUICK TIP

Hiding the FOUC (Flash of Unstyled Content)

Add v-cloak to DOM item "holding" your app

Add a style declaration to hide it.

```
<style>  
[v-cloak] {display: none}  
</style>
```

```
<div id="app" v-cloak>
```

FULL EXAMPLE: FORM VALIDATION

Do I need to explain this?

Check on submit, report on top

More examples: <https://vuejs.org/v2/cookbook/form-validation.html>

FULL EXAMPLE: AJAX SEARCH

Accept user input

Send to remote API...

- <https://www.openbrewerydb.org/documentation/03-search>

Render responses

COMPONENTS

Re-usable objects of awesome-ness

Template + Logic + Style = Component

Also solves one of HTML's most glaring problems...

<kitten>

EXAMPLE

```
Vue.component('kitten', {
  template: '',
  data() {
    return {
    }
  },
  computed: {
    url: function() {
      let theUrl = 'http://www.placekitten.com/'+this.width+'/'+this.height;
      return theUrl;
    }
  },
  props: {
    height: {
      default: 400,
    },
    width: {
      default: 400
    }
  }
});
```

EXAMPLE

```
<div id="app">
  <h2>Default</h2>
  <kitten></kitten>
  <p>
    <h2>H/W</h2>
    <kitten width="299" height="499"></kitten>
  </div>
```

COMPONENT EXAMPLES

Google Static Maps: <https://www.npmjs.com/package/vue-static-map>

Bootstrap: <https://bootstrap-vue.js.org/>

Vuetify: <https://vuetifyjs.com/en/>

```
<b-tabs>
  <b-tab title="first" active>
    <br>I'm the first fading tab
  </b-tab>
  <b-tab title="second" >
    <br>I'm the second tab content
  </b-tab>
  <b-tab title="disabled" disabled>
    <br>Disabled tab!
  </b-tab>
</b-tabs>
```

MORE COMPONENT STUFF

You can pass data in from the parent

You can listen for events from the component

"Sub children" (Slots)

```
<mything>
```

```
<template v-slot:thankyou>
```

```
Hey, I want to <i>really</i> thank you for taking  
the time to do whatever. We here at Mega Corp truly  
care that you took the time. Oh, and here, please  
take a kitten!
```

```
</template>
```

```
</mything>
```

FULL EXAMPLE: PLACEHOLDER

Create an `<image-placeholder>` tag

Use placeholder.com (or any other service)

Accept height and width (with defaults)

WELCOME TO APP COUNTRY...

THE CLI

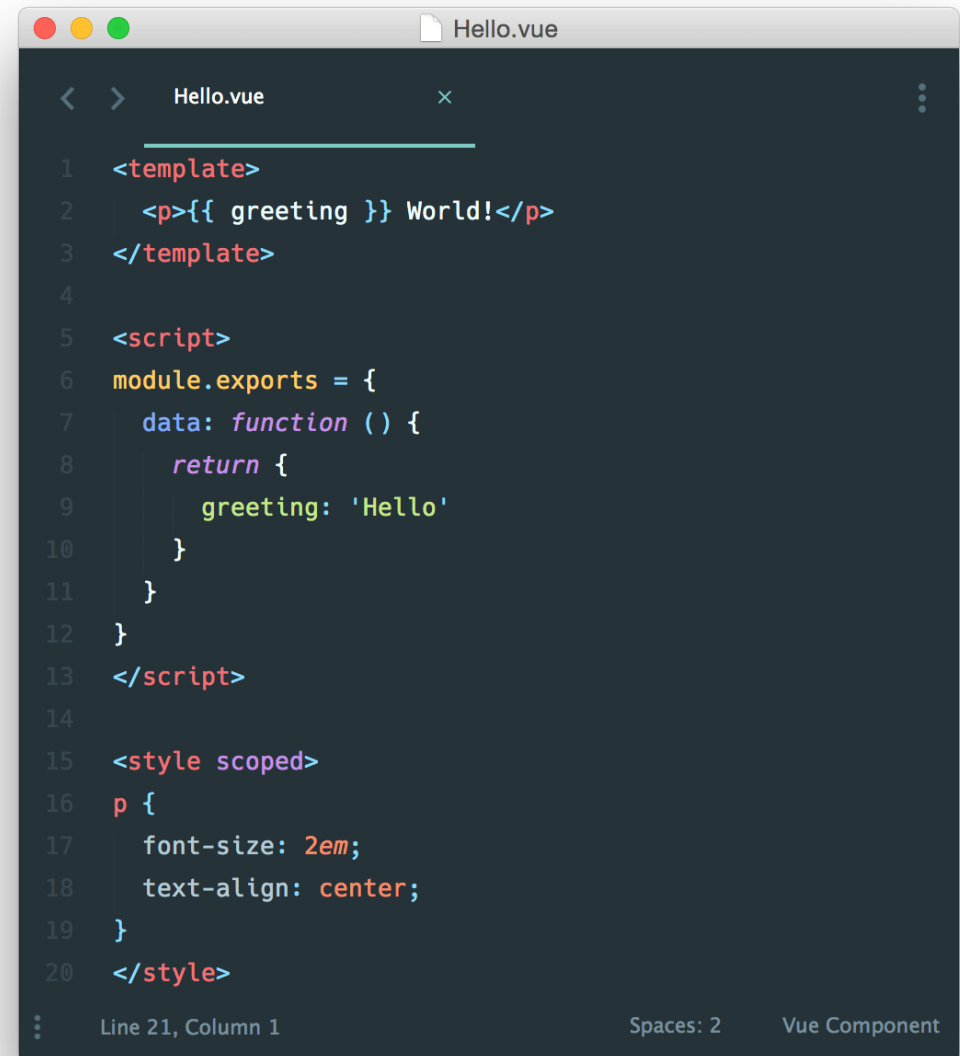

Scaffolding tool

Focused on SPAs (but also does prototyping well)

<https://cli.vuejs.org>

Supports Single File Components

SINGLE FILE COMPONENTS

The image shows a code editor window titled "Hello.vue". The code is written in Vue.js single-file component syntax, consisting of three blocks: `<template>`, `<script>`, and `<style>`. The `<template>` block contains a paragraph element with a Vue interpolation `{{ greeting }}` followed by the text "World!". The `<script>` block defines a module with a `data` function that returns an object containing `greeting: 'Hello'`. The `<style>` block is scoped and contains CSS rules for the `p` element, setting `font-size: 2em` and `text-align: center`. The editor interface includes a file explorer on the left, a breadcrumb "Hello.vue", and a status bar at the bottom indicating "Line 21, Column 1", "Spaces: 2", and "Vue Component".

```
1 <template>
2   <p>{{ greeting }} World!</p>
3 </template>
4
5 <script>
6 module.exports = {
7   data: function () {
8     return {
9       greeting: 'Hello'
10    }
11  }
12 }
13 </script>
14
15 <style scoped>
16 p {
17   font-size: 2em;
18   text-align: center;
19 }
20 </style>
```

Line 21, Column 1 Spaces: 2 Vue Component

WALKTHROUGH

FYI, install via: `npm i -g @vue/cli`

Then: `vue create foo`

Or: `vue serve (with App.vue)`

ROUTING

Not a part of Vue

Official library: vue-router (<https://router.vuejs.org>)

Maps URL paths to components

Supports dynamic paths

EXAMPLE (FROM THE DOCS)

```
const routes = [
  { path: '/foo', component: Foo },
  { path: '/bar', component: Bar }
]

const router = new VueRouter({
  routes // short for `routes: routes`
});

const app = new Vue({
  el: '#app',
  router
});
```

EXAMPLE (STILL FROM THE DOCS)

```
<div id="app">
  <h1>Hello App!</h1>
  <p>
    <router-link to="/foo">Go to Foo</router-link>
    <router-link to="/bar">Go to Bar</router-link>
  </p>
  <router-view></router-view>
</div>
```

FULL EXAMPLE: MAIN/DETAIL

First page - list of data

Second page - detail

STATE MANAGEMENT

Solves a problem you may not have!

One component, one set of data = easy

Two components, two set of data = mostly easy

Many components, one set of data = um....

VUEX

(Another) library for Vue (deeply integrated)

"Store"

Components can read from the store

Components cannot change data in the store (directly)

VUEX — LEARN MORE

<https://vuex.vuejs.org/>

3.0 - WHAT'S NEXT?

VUE 3.0

Faster, smaller

- Virtual DOM rewrite, native Proxy, 100% faster component instance initialization
- 20kb to roughly half (gzipped)

Multiple v-model support

- `<MyThing v-model:rank="userRank" v-model:title="userTitle" />`

Suspense

- Fallback support (ie, show this while loading)

Portals

- Render content elsewhere, uses a `<Teleport>` tag

VUE 3.0

TypeScript Support

- Vue itself - all in TS

No need for "wrapper" divs in template blocks (aka "Fragments")

VUE 3.0

temp.vue > template

```
1  <template>
2    <p>
3      Hello {{ name }}
4    </p>
5    <p>
6      How are you?
7    </p>
8  </template>
```

VUE 3.0

```
▼ temp.vue > ...  
1  <template>  
2    <div>  
3      <p>  
4        Hello {{ name }}  
5      </p>  
6      <p>  
7        How are you?  
8      </p>  
9    </div>  
10 </template>
```

VUE 3.0

VUE 3.0

TypeScript Support

- Vue itself - all in TS

No need for "wrapper" divs in template blocks (aka "Fragments")

Mounting changes to global libraries (add stuff to your Vue app, not global Vue object)

Composition API

- OPTIONAL new way of writing components
- Better for larger, complex architectures

Official repo: <https://github.com/vuejs/vue-next>

VUE 3 - RIP

Filters (deprecated)

render function (changed)

Event Bus (deprecated)

Photo by [Charles Deluvio](#) on [Unsplash](#)
